Technical Overview

In this document, we are going to capture changes in source data. Using DBT Snapshot, we will version the records and then use view model to refresh the view and observe the change in data in Gold schema.

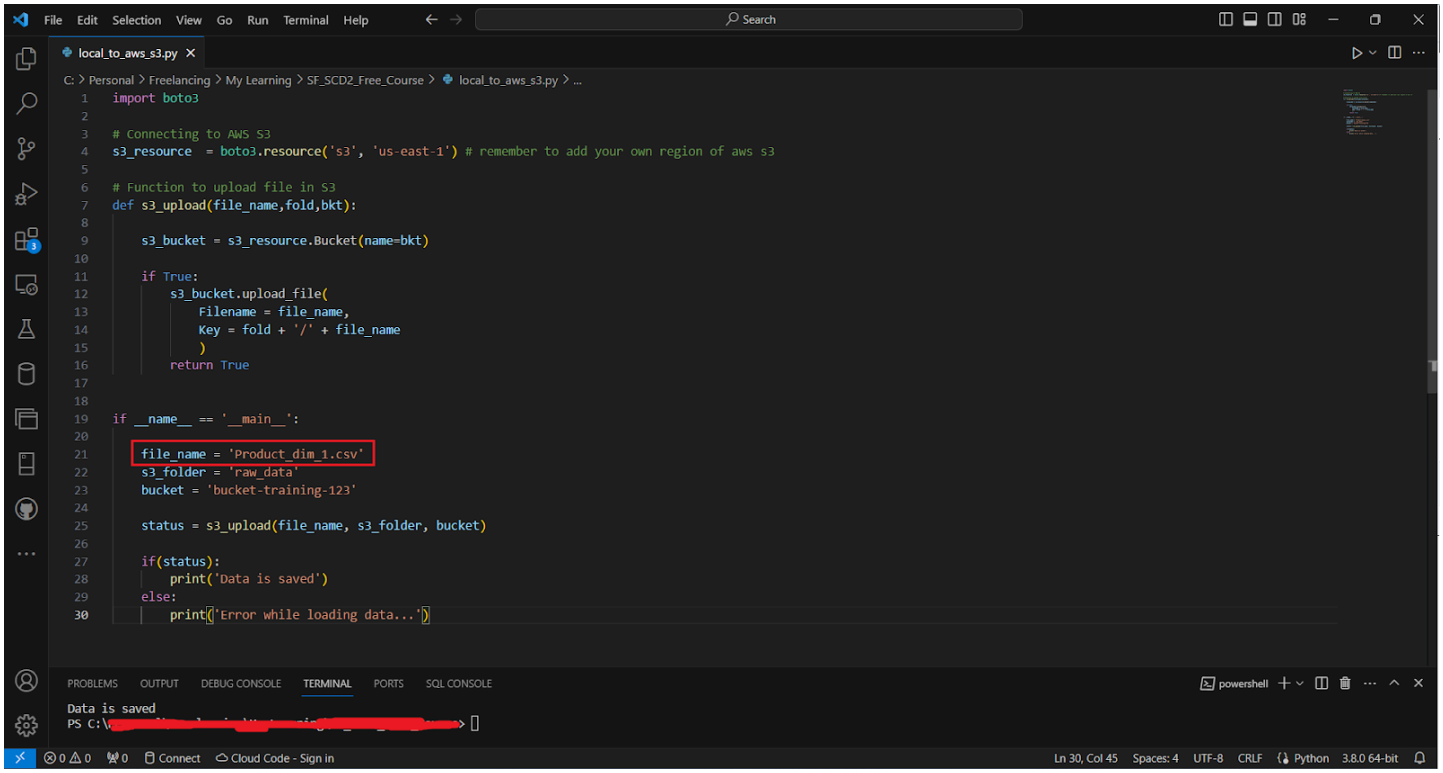

Pre-requisites:

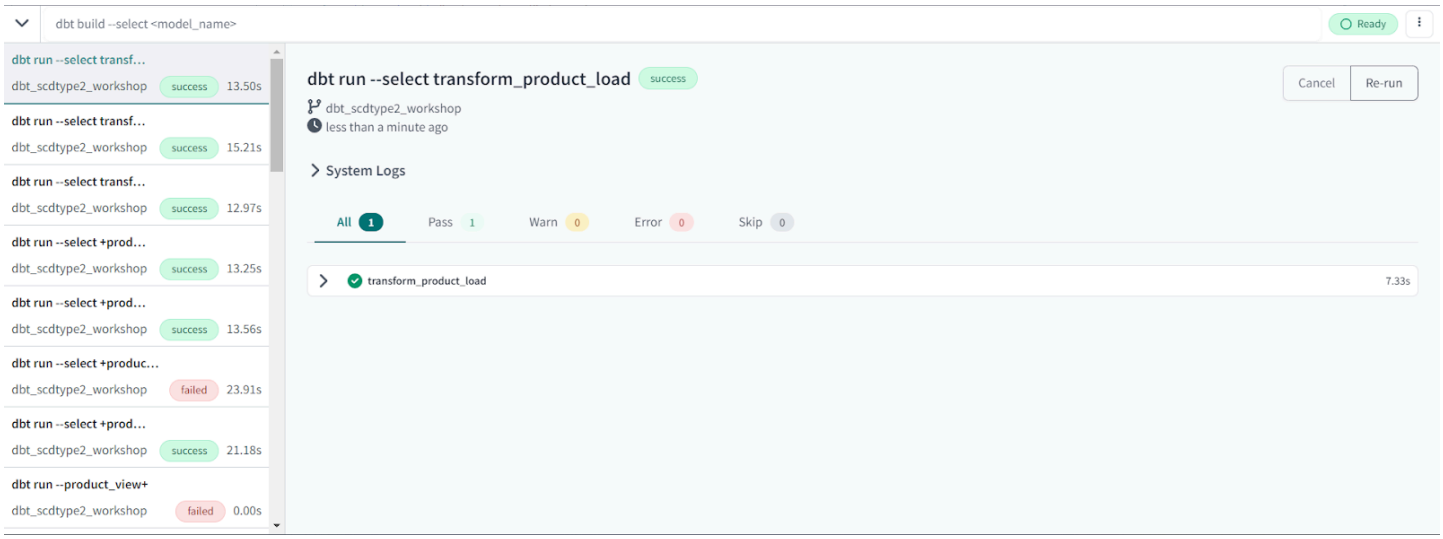

- **Snowflake Account**
- **DBT Cloud Account**

Demonstration

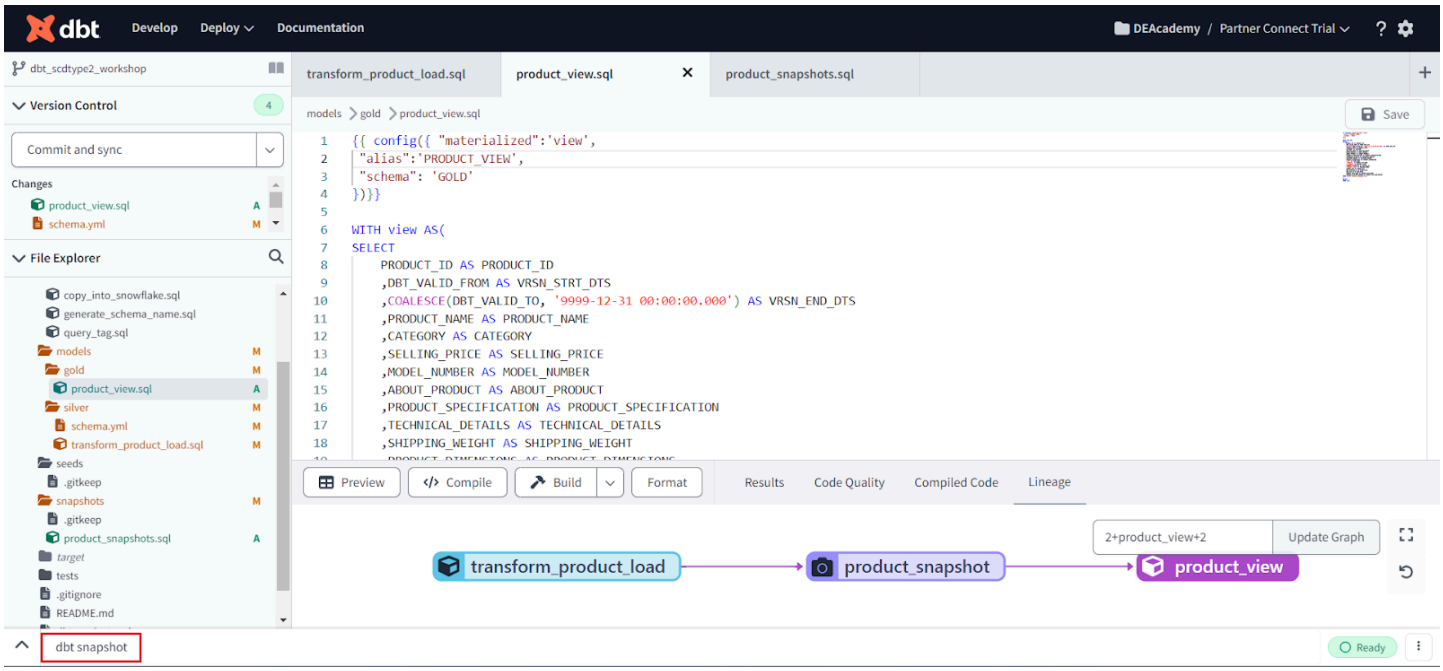

1. Upload the file with a change in record using python. Use same python by changing file name as you may have created for changes.

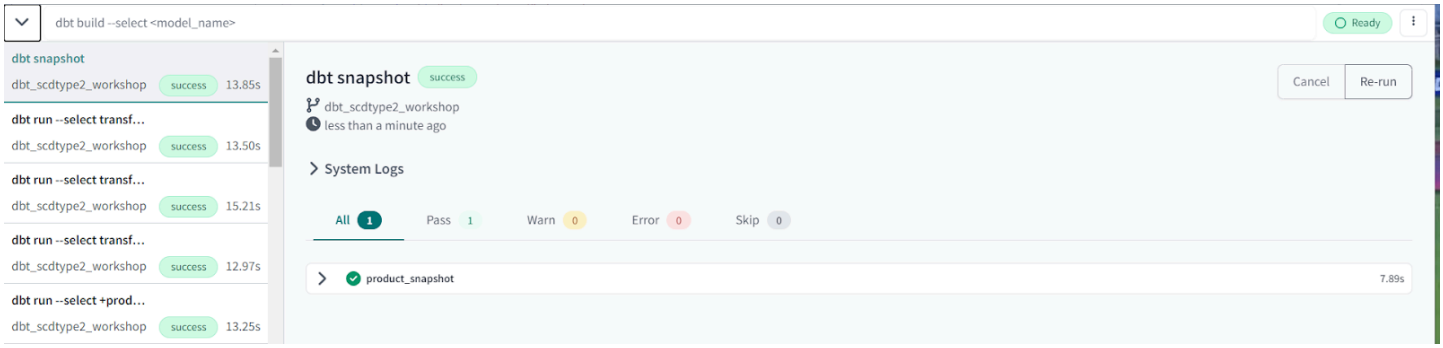

2. After upload is done run dbt run –select transform_product_load to load source data.

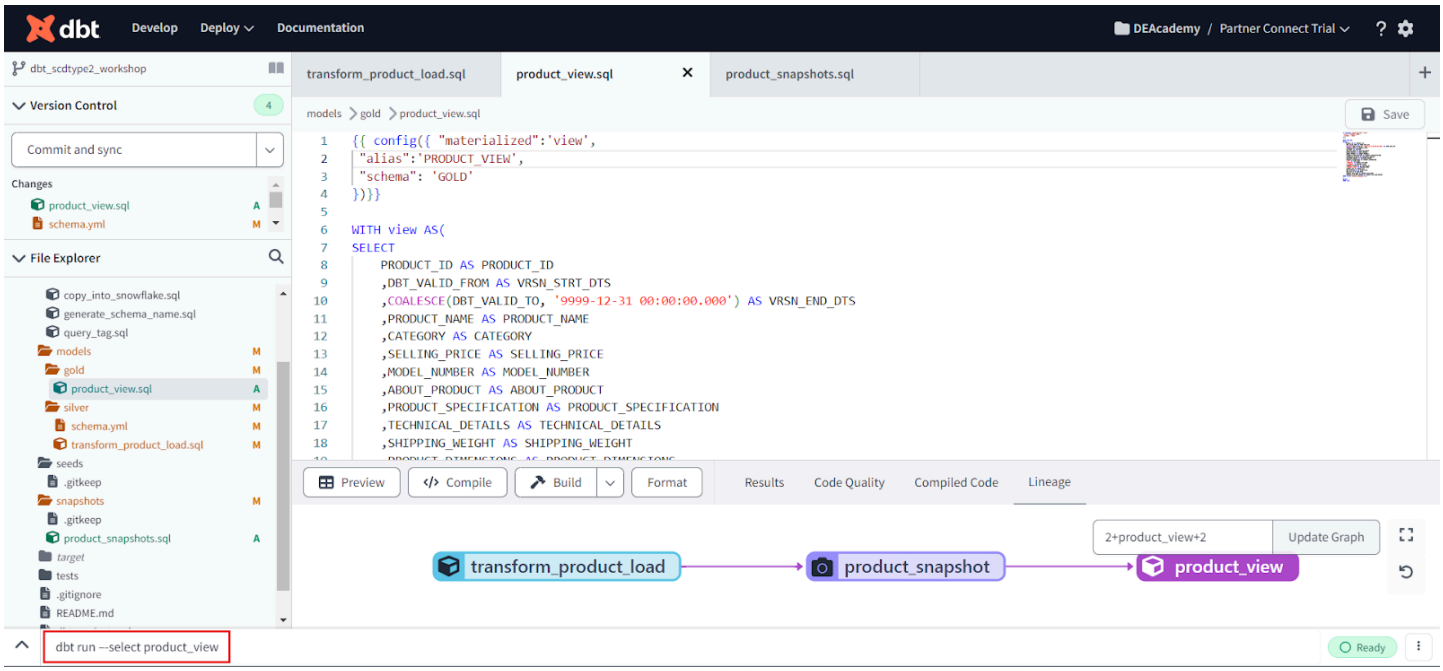

3. Now let us capture the change in data using dbt snapshot command.

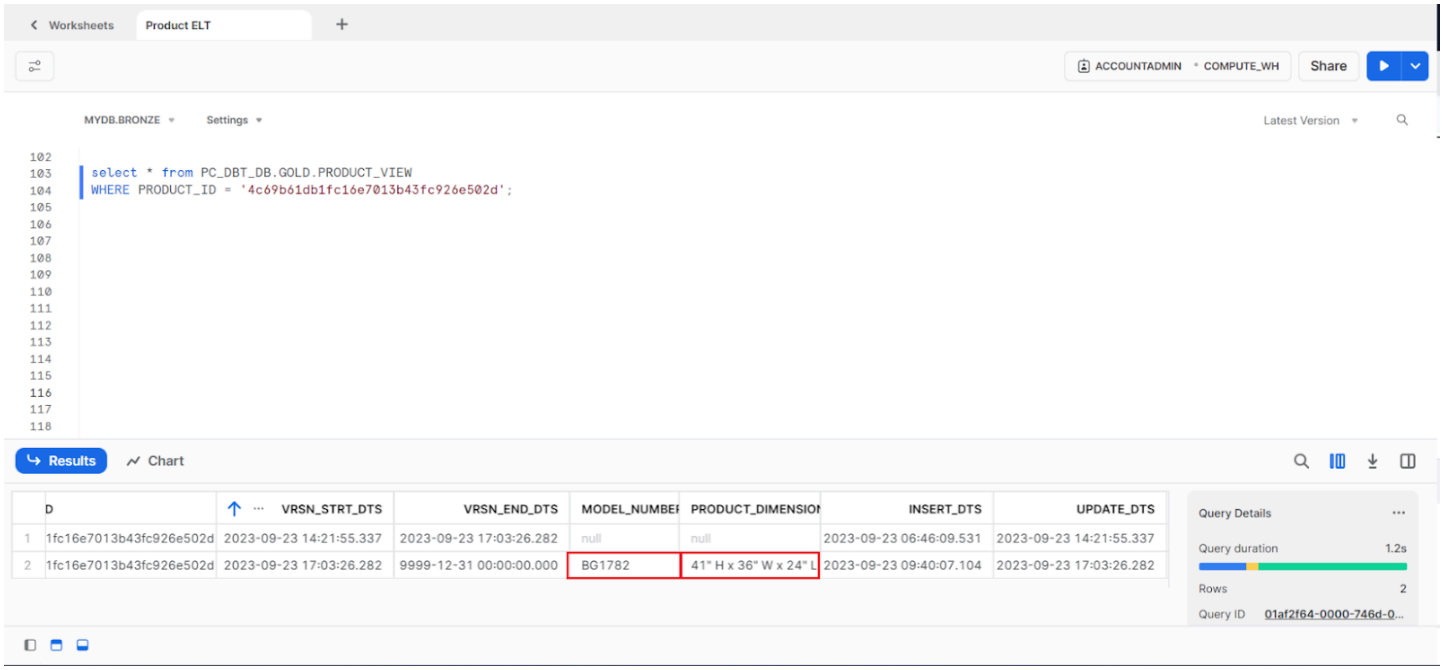

4. After the changes have been captured, run dbt run –select product_view to refresh the view in Gold schema.

5. After successful run in DB, go to Snowflake worksheet and run below command to see the change in data and being versioned.

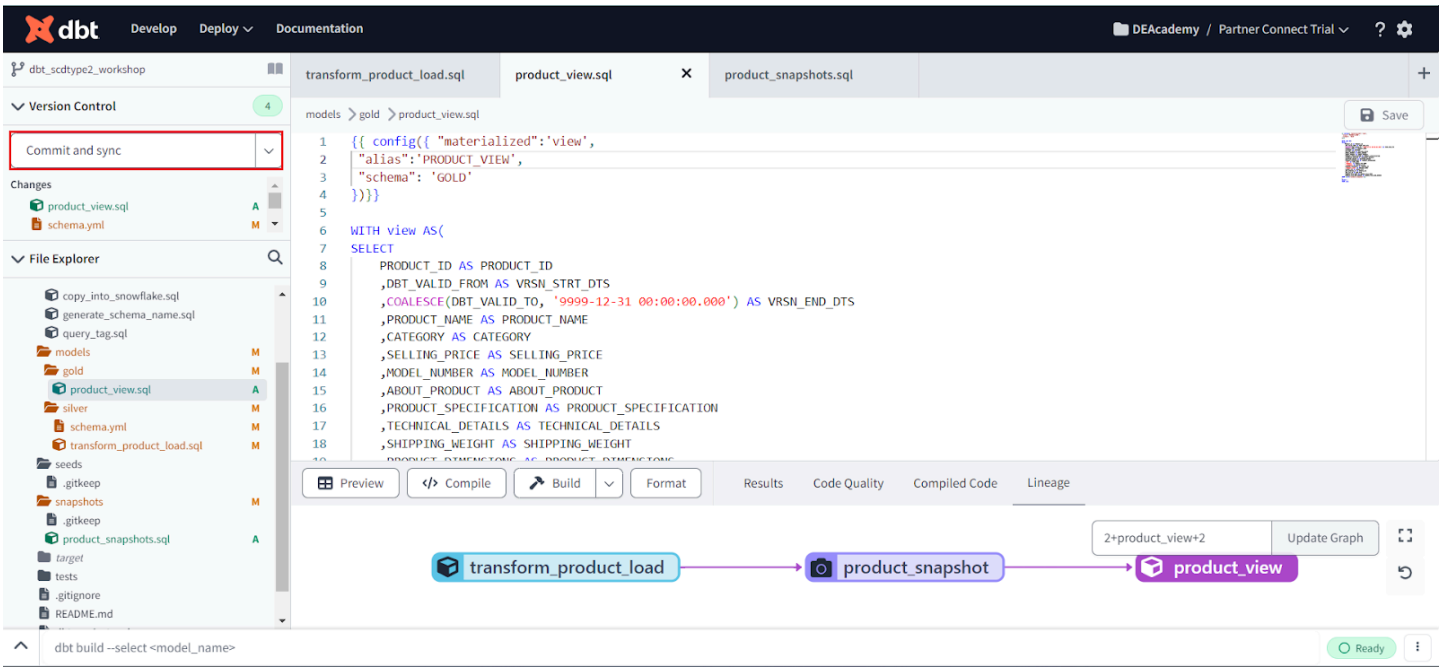

select * from PC_DBT_DB.GOLD.PRODUCT_VIEW

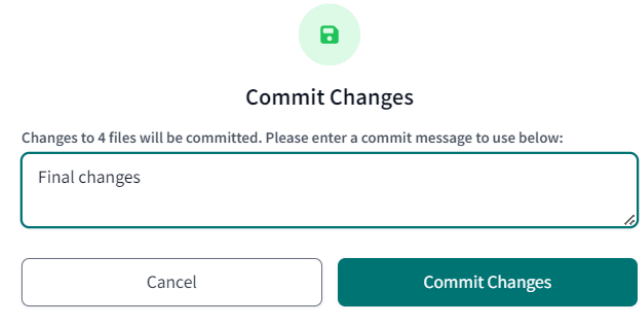

WHERE PRODUCT_ID = '4c69b61db1fc16e7013b43fc926e502d';

Notice the data getting changed and the version columns getting updated.

6. After go to DBT and click on Commit and Sync and then add a message to proceed. Click on Commit Changes.

Successfully demonstrated SCD Type 2 Versioning and observe data using view in Gold layer.
